

INDOOR ENVIRONMENT-

New technology and sensors. “Setting the standard”

Professor Bjarne W. Olesen, PhD

Director

International Center for Indoor Environment and Energy

Department of Mechanical Engineering

Technical University of Denmark

INDOOR - OUTDOOR

- Highest exposure to the indoor environment
- People spend ~90 % of the time indoors during work, during transportation and at home

INTAKE FOR A PERSON PER DAY

- 1 kg FOOD
- 2 kg LIQUID
- 15 kg AIR

COMFORT-PRODUCTIVITY

Building costs

People	100
Maintenance	10
Financing	10
Energy	1

SENSES

INDOOR ENVIRONMENT

- THERMAL
- AIR QUALITY
- ACOUSTIC
- LIGHT

**Large field studies show
substantial rates of dissatisfaction in practice**

**(Mendell, 1993; Fisk et al., 1993;
Bluyssen et al., 1994; Sundell, 1994;
Sekhar et al., 2000; Bischhof 2000)**

In typical office buildings

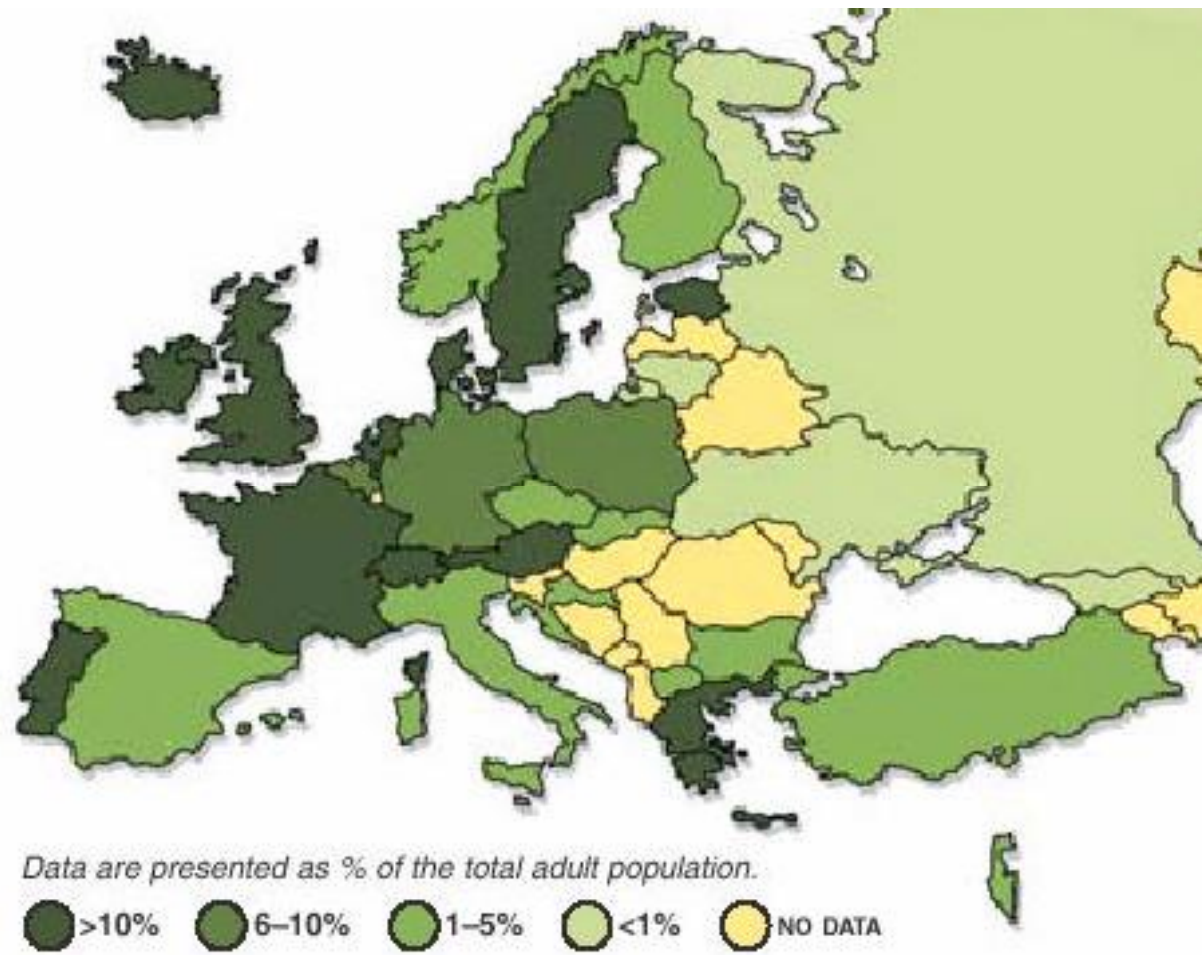

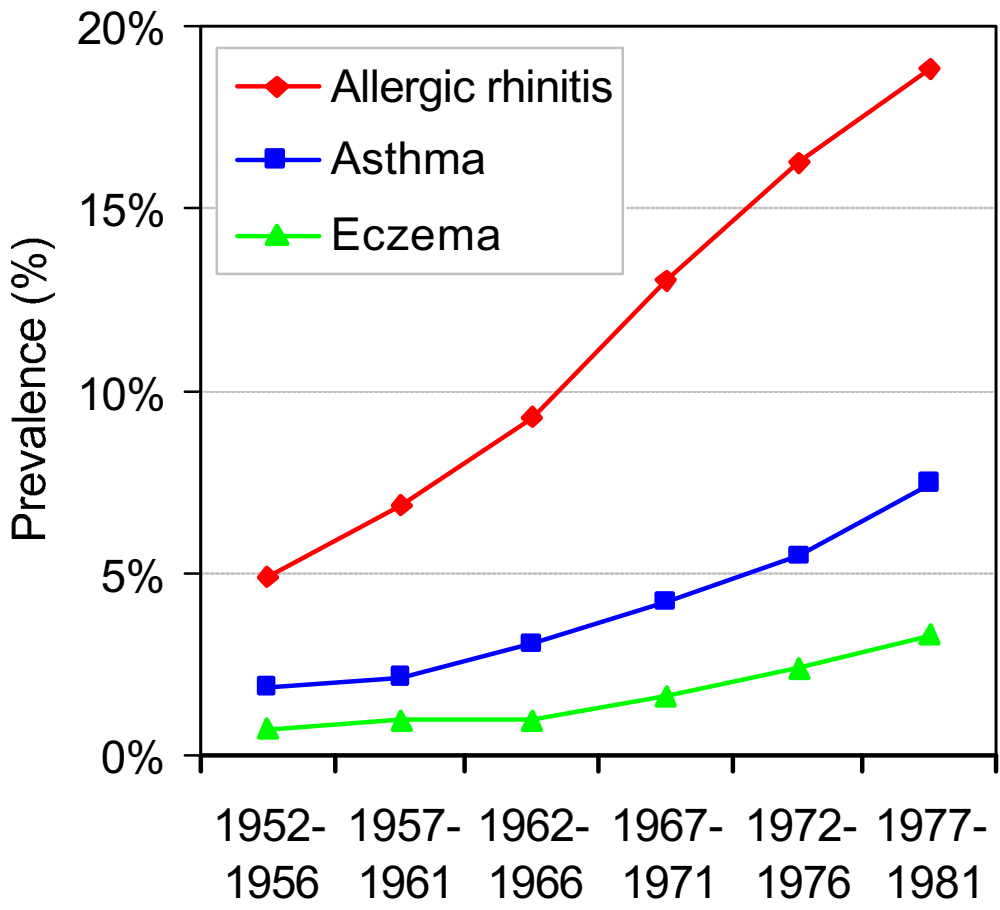

- **20-40% of occupants with SBS symptoms**
- **20-40% of occupants finding the IAQ unacceptable**

even though existing ventilation standards are met.

**We guarantee that less than
30% of our customers will
be dissatisfied !**

HEALTH

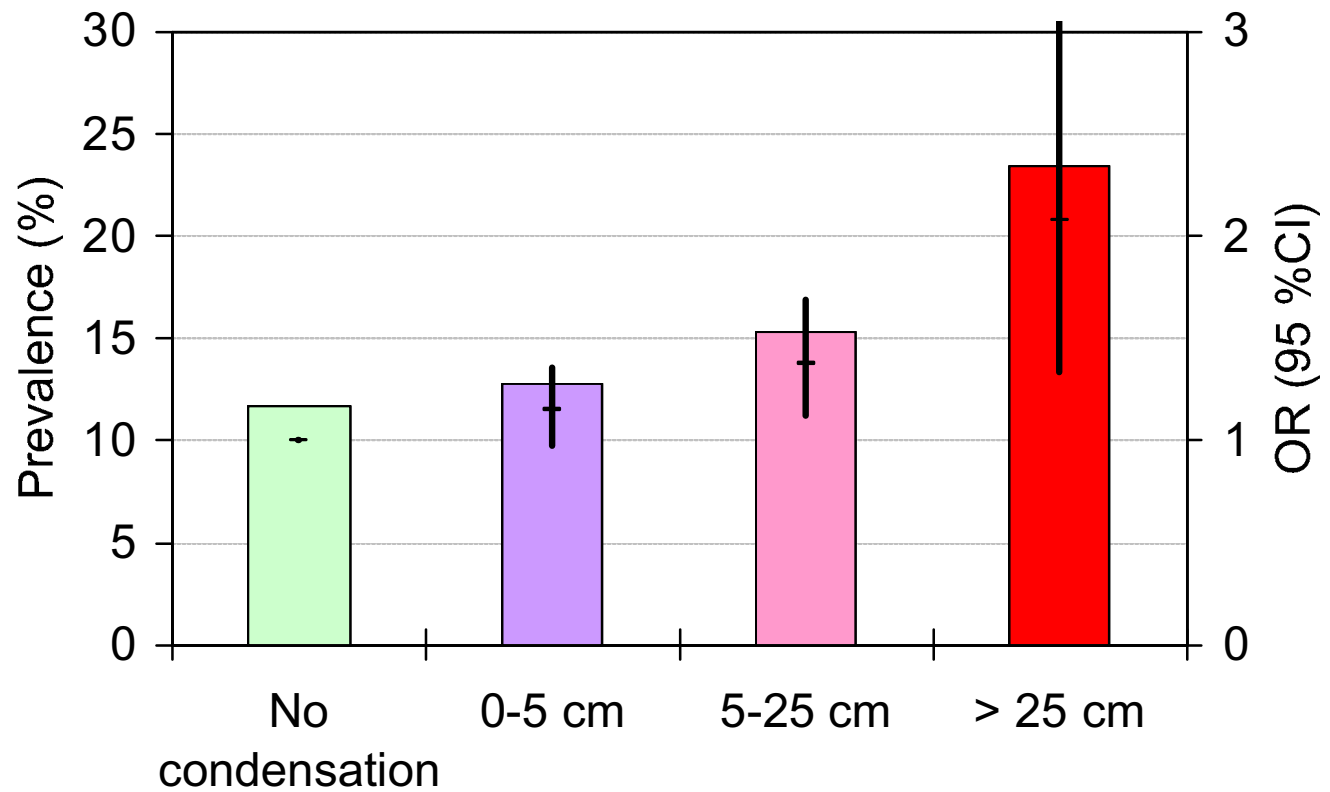

Left: Trends for allergic rhinitis, asthma and eczema among male conscripts (17-20 years age) in Sweden (Bråbäck et al., 2004).

Right: Current data on prevalence of asthma in adults in Europe (Loddenkemper et al., 2003).

Odds ratio for being a “case”, i.e. children with at least two symptoms of possible three (wheezing, rhinitis, eczema) as a function of ventilation rates, in single family houses. (Bornehag et al., 2003).

Condensation on window pane in bedroom

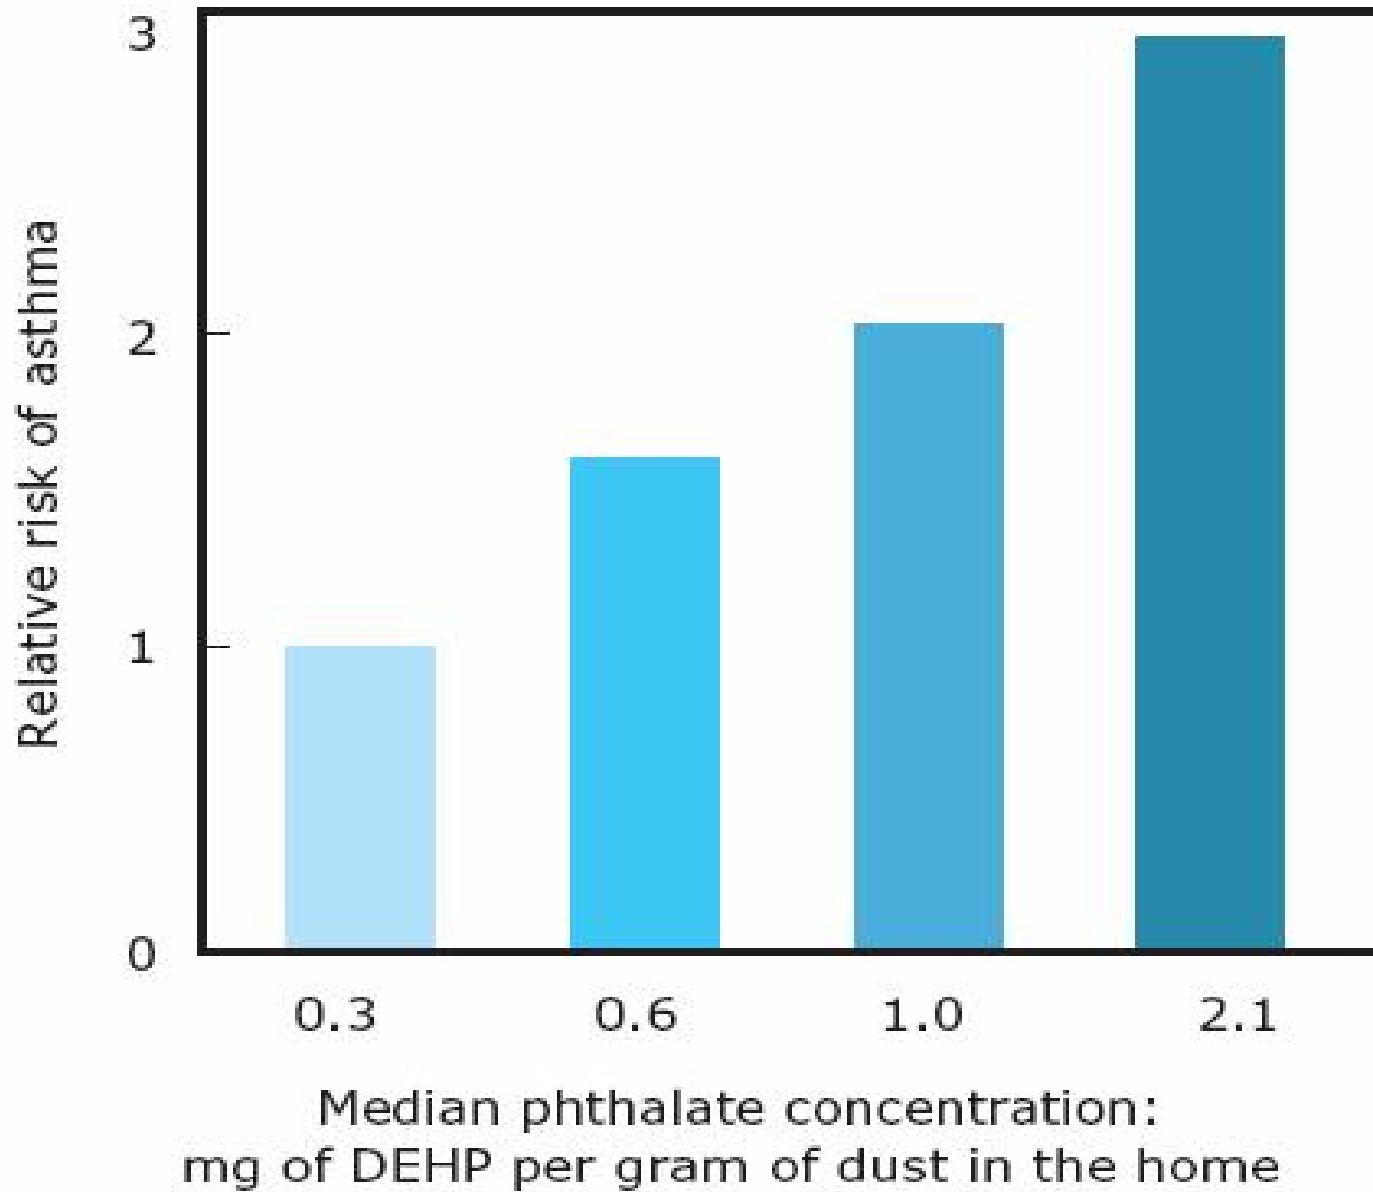

Left: Window water condensation is often a sign of poor ventilation in dwellings;

Right: Prevalence and odds ratio for rhinitis among children versus condensation on window pane in a bedroom (source: DBH-study group, in press).

Indoor Pollution Sources

Plasticizers from polyvinyl chloride in dwellings increase the risk of asthma among children.

Each column represents about 90 dwellings.

DEHP: di(2-ethylhexyl) phthalate.

The sensory pollution load in an office where either ozone (15 ppb) or limonene (83 ppb) were present separately or both ozone and limonene (15 ppb+83 ppb respectively) were mixed in the office air (Tamás et al., 2005); the increased sensory pollution load is due to the presence of reaction products in the office air.

INDOOR ENVIRONMENT- PERFORMANCE

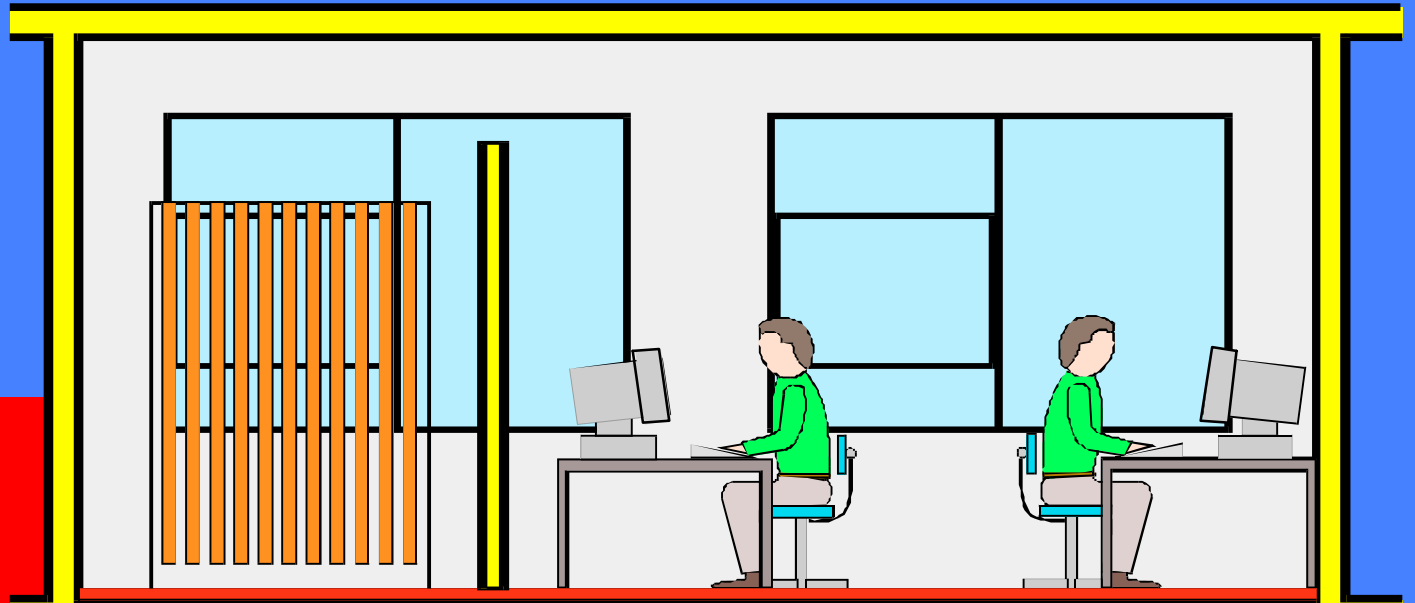

- Self evaluation of productivity-WEP
9-Punkt scale
- $WEP = 6.739 - 0.419E - 0.164JD - 0.048JS$
- E = Dissatisfaction-Environment
- JD = Job satisfaction
- JS = Job stress

PERFORMANCE

Studies on the relation between the indoor environment and peoples performance

Method

Non-low-polluting
building

Low-polluting
building

Experimental set-up

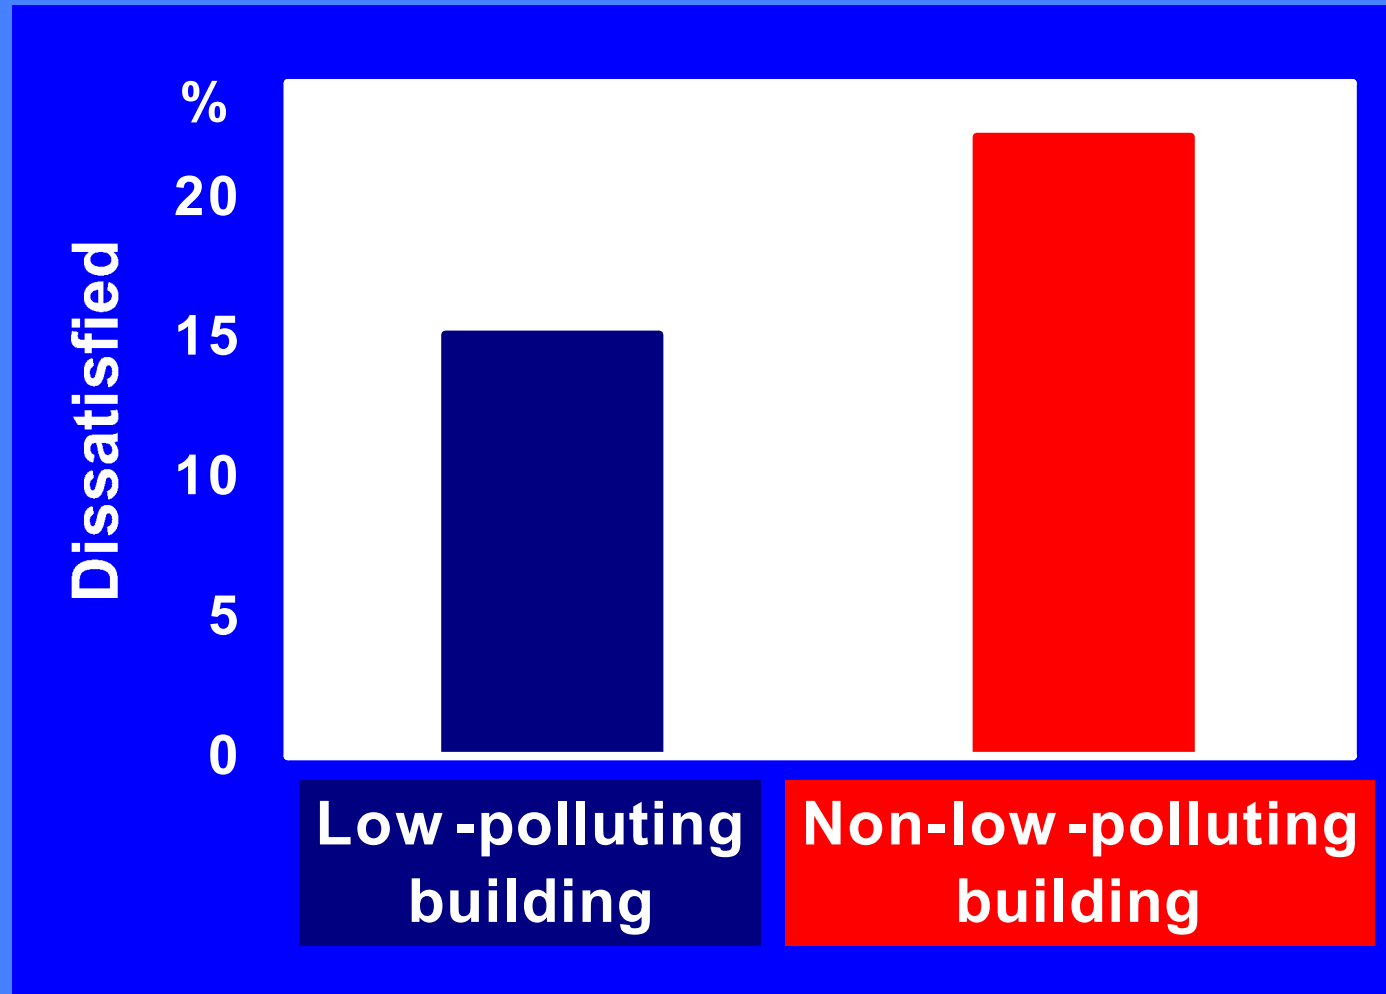

Subjects & procedure

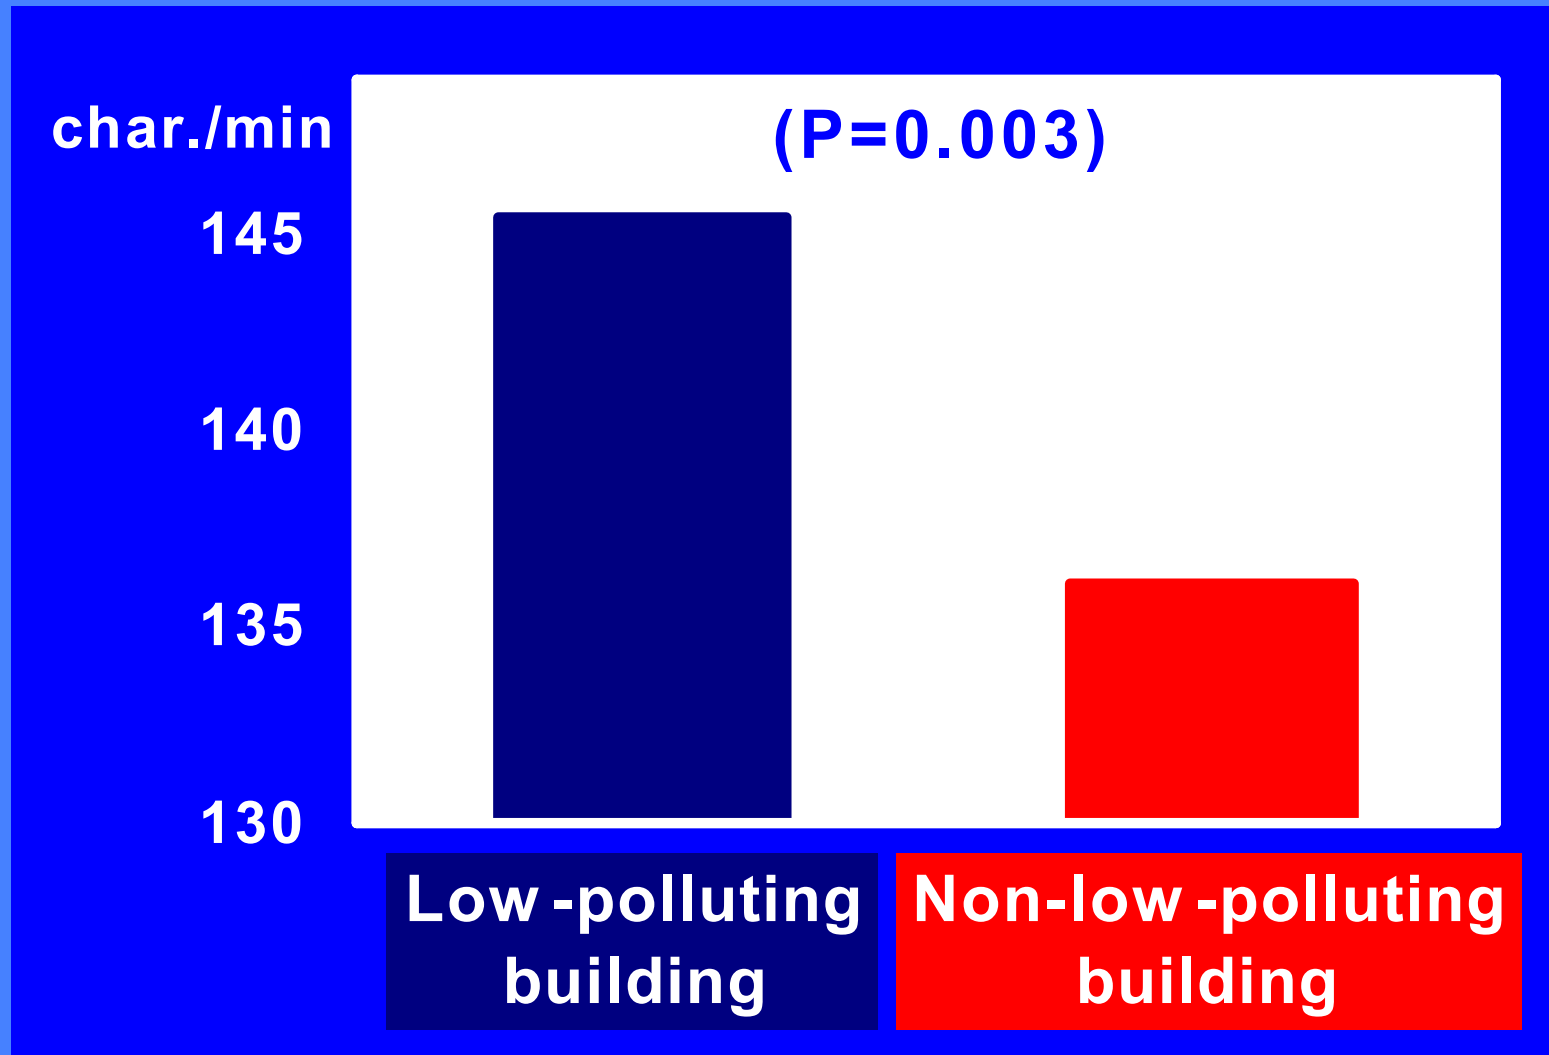

- ◆ 30 healthy females
- ◆ 20-31 years old
- ◆ performed simulated office work during 4.4 hours' occupation of the office:
 - text typing
 - arithmetical calculations
 - creative thinking

Perceived air quality

Speed of text typing

Headache

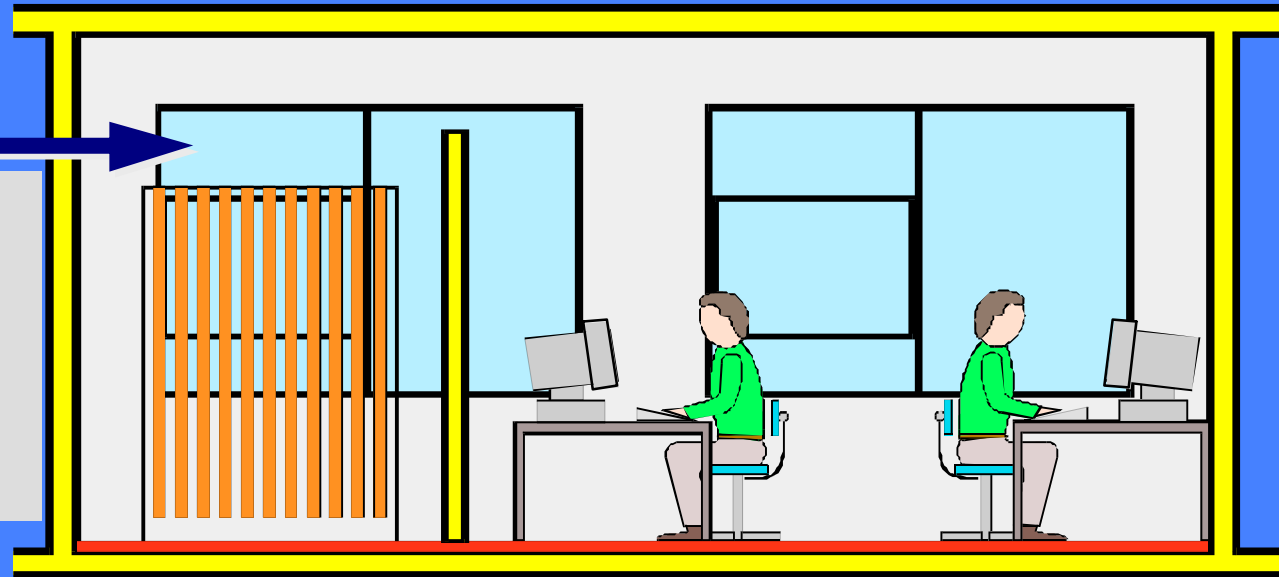

Methods

Outdoor air rates:

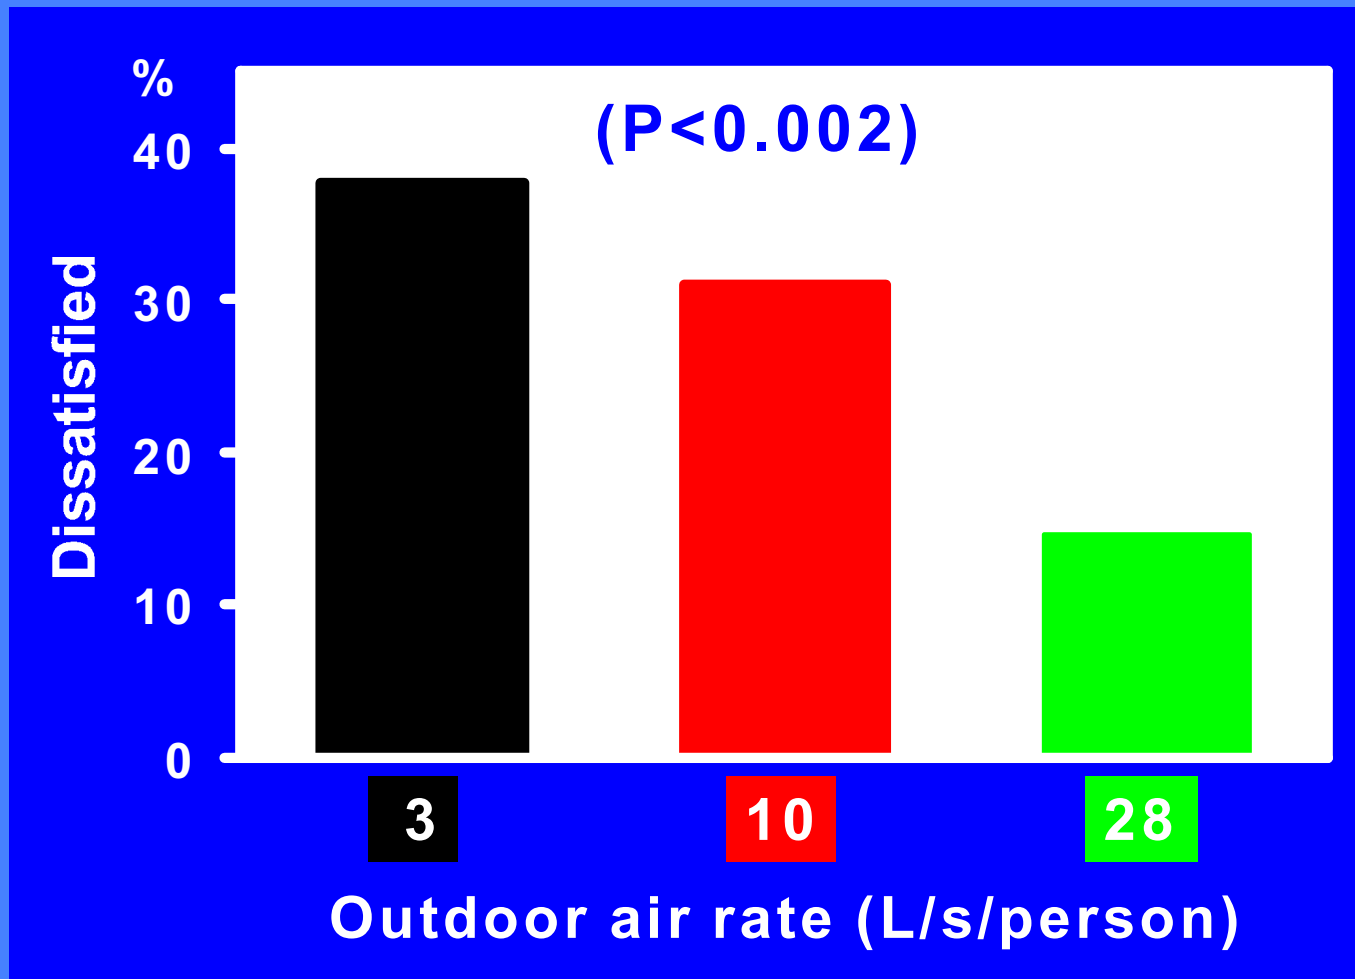

3 L/s/person (0.6 h^{-1})

10 L/s/person (2 h^{-1})

30 L/s/person (6.0 h^{-1})

Perceived air quality

Productivity

RADIANT TEMPERATURE ASYMMETRY

- HEATED CEILING: < 5 °C
- COOLED CEILING: < 14 °C
- WARM WALL: < 23 °C
- COOL WALL: <10 °C

Vertical air temperature difference

The coal shortage 1917

By occupying the space near the ceiling the heat will be fully utilized- the redundant floor can then be used for growing potatoes. R. Storm. P.

Category	Vertical air temp. diff. K
A	< 2
B	< 3
C	< 4

FLOOR TEMPERATURE

- SEATED/STANDING PERSONS:
 $19\text{ }^{\circ}\text{C} < t_s < 29\text{ }^{\circ}\text{C}$
- BY HIGHER ACTIVITY LEVELS A LOWER FLOOR TEMPERATURE IS ACCEPTABLE

Directive of the European Parliament and of the Council on the energy performance of buildings

The energy performance of buildings should be calculated on the basis of a methodology, which may be differentiated at regional level, that includes, in addition to thermal insulation other factors that play an increasingly important role such as heating and air-conditioning installations, application of renewable energy sources and design of the building.

DIRECTIVE (Art.7) Energy performance certificate

- Member States **shall take measures** to ensure that for buildings with a total useful floor area over 1 000 m² occupied by public authorities and by institutions providing public services to a large number of persons and therefore frequently visited by these persons an energy certificate, not older than 10 years, is placed in a prominent place clearly visible to the public.
- The range of recommended and current indoor temperatures and, when appropriate, other relevant climatic factors **may also be clearly displayed.**

DIRECTIVE (Art.11)

- Moreover, the displaying of officially **recommended indoor temperatures**, together with the **actual measured temperature**, should discourage the misuse of heating, air-conditioning and ventilation systems.
- This should contribute to avoiding unnecessary use of energy and to **safeguarding comfortable indoor climatic conditions** (thermal comfort) in relation to the outside temperature.

INSPECTION

- **Boiler and Heating System**
- **Ventilation System**
- **Air- (Room) Conditioning System**

INSPECTION

- **Development of a standard inspection procedure**
 - Boilers and heating systems
 - Ventilation systems
 - Cooling systems (Air or Room Conditioning)
- **Education of inspectors**

INSPECTION

DO IT LIKE THE CARE INDUSTRY

INSPECTION

- **Use same concept as for cars:**
 - Plug in of PC for download of data
 - Build in sensors
 - No fixed inspection intervals (Months or Distance)
 - Calculation of required inspection
 - Self diagnostic

FUTURE NEEDS FOR HVAC SYSTEMS

- **More build in sensors for diagnostic and inspection**
- **Algorithms for calculation of time for service and inspections**
- **Running calculation of energy consumption**
- **More separate measurements of electrical energy use**
- **Feedback to user regarding energy consumption and indoor environment**

FUTURE TRENDS

- **Integrated design of building and HVAC systems**
- **Separation of heating-cooling system from ventilation**
- **Low-temperature heating and high-temperature cooling**
- **Use of renewable energy sources (heat pumps, ground heat exchangers, geothermal)**
- **Reduction of peak loads**

OPPORTUNITIES FOR THE HVAC INDUSTRY

- Earlier involvement in the building process
- More jobs (energy certificates, inspections, service)

CONCLUSIONS

- An optimal indoor environment is the most important requirement for a healthy, comfortable and productive working environment
- For each 10 % increase in dissatisfaction the performance will decrease with ~1.5%
- To reduce energy consumption by decreasing the quality of the indoor environment is a bad investment
- An energy certificate make no sense without a certificate for the indoor environment
