

## Productivity Boost

Improving a meat company's competitiveness through increased product through-put without increasing the operating cost

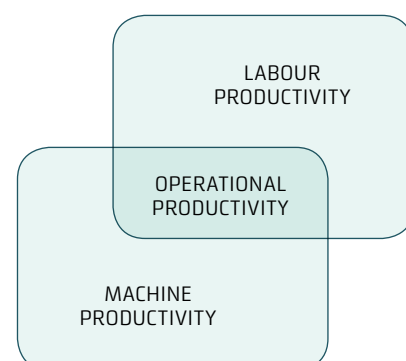

### PRODUCTIVITY BOOST

A meat company's bottom line is heavily dependent on its ability to utilize equipment and operators at the production plant 100%. Productivity is production at a higher value than the business costs within a working day.

According to the experience of DMRI, the potential of improvements in productivity is 5-10% of the total cost per kg produced.

The productivity boost implies increasing the amount of kg and/or units produced with the lowest number of operators possible – and utilizing each production hour to the fullest.

- Increased speed and through-put at fixed cost
- Increased line speed or productivity based salary system and rewards
- Fewer employees to do the same task
- Balancing and staffing of lines
- Product and by-product description and specifications of work methodology
- Education, operators' professional skill
- Organizing, planning, KPI and communication
- Layout, avoid bottlenecks and workplace arrangement

## Productivity Boost

### THE PRODUCTIVITY BOOST APPROACH

- 1 SCREENING OF PRODUCTION AND CALCULATION OF POTENTIAL
- 2 AGREEMENT OF THE POTENTIAL AND IMPLEMENTATION OF PRODUCTIVITY BOOST
- 3 FOLLOW-UP VISITS

### THE PRODUCTIVITY BOOST RUNS FOR 12 MONTHS

From the international meat industry, our experts have an extensive, practical and innovative experience in obtaining positive economic results from boosting the companies' productivity.

Our approach will ensure a sustained performance.

#### ABOUT DMRI

DMRI conducts research and offers consulting on methods and technologies for the efficient production of safe, high quality and price competitive meat products. DMRI is committed to continuously improve workplace conditions and animal welfare as well as to take due care of the external environment.
